PROFESSIONAL SUMMARY

Software Engineer with 6+ years of experience designing resilient full-stack applications, modern frontend ecosystems, and agentic AI systems. Deep expertise in TypeScript, React/Next.js, Python, and cloud-native infrastructure, with a track record of speeding up system pipelines by up to 81% and leading production launches across web, mobile, and Web3 platforms.

SKILLS

Backend	TypeScript, NodeJS, NestJS, Python, FastAPI, PostgreSQL, Redis
Web & Mobile	TypeScript, React, NextJS, Tailwind CSS, TanStack Router & Query
Cloud, Infra & DevOps	Docker, Kubernetes, Proxmox, Cloudflare, GCP, AWS, CI/CD (GitHub Actions)
AI & Agentic Systems	LLM Integrations, MCP Server Creation, RAG & Vector Search

WORK EXPERIENCE

Fullstack Engineer (Contract) · Tridorian, Singapore (Remote) Jun 2026 – Present

Observability, performance, and reliability across a 6-service AI platform for medical-legal document analysis.

- Built end-to-end distributed tracing using OpenTelemetry and GCP Cloud Trace (with Pub/Sub propagation), transforming an unobservable multi-service ecosystem into a fully traceable architecture that surfaced critical bottlenecks.
- Sped up report generation by 74% (35 to 9 minutes) using parallel AI fan-out and cut event extraction time by 81% (21 to 4 minutes).
- Hardened system reliability by auditing critical error paths and resolving silent failures, ensuring all runtime exceptions surface accurately in distributed traces instead of getting swallowed.
- Eliminated a billing race condition by moving counter increments to atomic database operations, preventing parallel workers from overwriting usage counts and underbilling.
- Refactored worker pipelines and memory bottlenecks, cutting continuous memory usage by ~55% (from 800MB–1GB down to 300–500MB) and significantly reducing cloud compute costs.

Technical Consultant (Contract) · Heypico.ai, Singapore (Remote) Aug 2025 – Jun 2026

End-to-end development of AI agents, GraphRAG architecture, browser extension MVPs, mobile apps, resilient payment infrastructure, and custom device orchestration protocols.

- Engineered a GraphRAG retrieval pipeline using Neo4j and Graphitti with long-term memory modules, significantly improving context accuracy and reducing hallucination across AI workflows.
- Architected backend APIs and Model Context Protocol (MCP) integrations, automating multi-step financial reporting (Google Docs/Sheets) and transactional ordering flows to cut manual execution overhead.
- Built and launched an AI crypto analytics browser extension from scratch in 1 month, implementing real-time screen capture, chart vision analysis, and news sentiment extraction to accelerate product validation.
- Integrated Stripe and Midtrans payment gateways with idempotent webhooks and DB transactions to eliminate race conditions under peak traffic, backed by PostHog telemetry for user behavior tracking.
- Spearheaded the multi-platform MVP release across Web, Android, and iOS (driving the full App Store review lifecycle), while engineering Termux-based remote orchestration layers for companion hardware devices.
- Authored 10+ reusable AI middleware utilities and automated GitHub Actions CI/CD release pipelines, accelerating cross-team integration setup and feature delivery times.

Software Engineer (Full-Time) · Avataralabs.ai, Jakarta (Remote) Sep 2022 – Aug 2025

Frontend engineering and full-stack development across Generative AI platforms, web3 wallet infrastructure, and NFT ecosystems.

- Developed an AI Researcher Dashboard using RAG for personalization, driving 3x revenue growth and 5x client acquisition across livestreams and embedded chat tools.
- Led frontend architecture across 4 AI-driven products, including a content platform featuring TTS, STT, video generation, and real-time chat interfaces.
- Built end-to-end custodial and semi-custodial Web3 wallet solutions alongside a custom Web3 Provider SDK to streamline smart contract interactions for clients.
- Designed and implemented NFT landing pages, dashboards, and wallet UI flows in collaboration with backend and design teams.

Frontend Engineer (Full-Time) · Orami By SIRCLO, Tangerang Dec 2019 – Nov 2022

Frontend ecosystem engineering, design system development, and e-commerce core features across web and mobile platforms.

- Led frontend standardization across squads by building a unified component library with Storybook and Tailwind CSS, while driving the TypeScript migration to elevate code quality, type safety, and developer velocity.
- Built key e-commerce features including an online store for kids' apparel, social commerce group buying, and Express Mart for local shop discovery.
- Partnered with Lead Frontend Engineers on R&D initiatives, architectural evaluations, and frontend utilities to support multiple development squads.
- Overhauled merchant Seller Dashboard features, improving product management workflows for active e-commerce sellers.

PROJECTS

Nouverse Platform · Creator · app.nouverse.tech 2026 – Present

A Cloud Application Platform (Vercel-like PaaS) that automates full-stack deployments, custom domain routing, SSL provisioning, and multi-tenant billing.

- Automated cloud hosting with instant builds, isolated container orchestration, and dynamic Traefik/Cloudflare ingress for automatic SSL provisioning.
- Built a multi-tenant payment gateway and subscription system with real-time usage tracking and webhooks handling.
- Designed a scalable server architecture configured to seamlessly join and scale within a Kubernetes cluster.

Nouride AI Harness · Creator · nouride.com 2026 – Present

An ultra-lightweight, self-hosted multi-agent AI runtime for personal assistants (like OpenClaw or Hermes) designed for edge devices (down to a 512MB Raspberry Pi Zero 2).

- Architected a lightweight, single-binary daemon (~60MB) with a 64MB RAM baseline footprint and 0.7% single-core idle CPU, enabling 24/7 multi-agent operation on edge-devices.
- Implemented an integrated Human-in-the-Loop (HITL) approval gate and privilege ceiling to sandbox shell execution (`exec`) and prevent unauthorized system modifications.
- Implemented a deterministic Tool Output Spilling engine that auto-offloads oversized tool results to sandboxed disk storage, preserving context limits while allowing agents to paginate and inspect large outputs via read/grep.

Agent Memory Engine & MCP · Creator · agent-memory-blog.gading.dev 2026 – Present

An agent-agnostic open-source Model Context Protocol (MCP) server providing a vendor-agnostic long-term memory engine, hybrid RAG search, and modular skills architecture across multiple AI agents and IDEs (OpenClaw, Cursor, Zed, Claude Code).

- Architected a vendor-agnostic long-term memory MCP server using Python, pgvector, and dual transport protocols (Stdio/SSE).
- Built a hybrid retrieval system pairing pgvector semantic search with SQL analytics over daily summaries and automated fallbacks.
- Implemented markdown export integrations for personal knowledge management systems and graph visualization tools.
